

a relatively narrow frequency band in the neighbourhood of  $f_0$ .

→ Problems:

$$\text{Prove that } \textcircled{1} \quad E[n_c^2(t)] = E[n_s^2(t)]$$

$$\textcircled{2} \quad E[n_c(t) n_s(t)] = 0.$$

$$\text{Ans} \quad \textcircled{1} \quad E[n_c^2(t)] = E[n_s^2(t)]$$

$n_c(t)$  &  $n_s(t)$  are stationary random processes &

we know that  $E[a_k^2] = E[b_k^2] \rightarrow \text{equal variance}$

$E[a_k b_k] = 0 \rightarrow \text{uncorrelated to each other.}$

$$n_c(t) = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} [a_k \cos 2\pi(k-K)\Delta f t + b_k \sin 2\pi(k-K)\Delta f t]$$

$$E[n_c(t)] = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} [a_k \sin 2\pi(k-K)\Delta f t - b_k \cos 2\pi(k-K)\Delta f t]$$

$$\begin{aligned} \therefore E[n_c^2(t)] &= \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2 \cos^2 2\pi(k-K)\Delta f t + \\ &\quad b_k^2 \sin^2 2\pi(k-K)\Delta f t \\ &\quad + 2a_k b_k \cos 2\pi(k-K)\Delta f t \sin 2\pi(k-K)\Delta f t] \end{aligned}$$

$$= \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2 (\cos^2 2\pi(k-K)\Delta f t + \sin^2 2\pi(k-K)\Delta f t)] + 0$$

$$\left\{ \because E[a_k^2] = E[b_k^2] \in E[a_k b_k] = 0 \right.$$

$$= \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2] \quad \left\{ \because \cos^2 \theta + \sin^2 \theta = 1 \right\}$$

$$E[n_s^2(t)] = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2 \sin^2 2\pi(k-K)\Delta f t + b_k^2 \cos^2 2\pi(k-K)\Delta f t - 2a_k b_k \cos 2\pi(k-K)\Delta f t \sin 2\pi(k-K)\Delta f t]$$

$$= \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2 (\sin^2 2\pi(k-K)\Delta f t + \cos^2 2\pi(k-K)\Delta f t)] + 0$$

$$\Rightarrow E[n_c^2(t)] = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E[a_k^2]$$

$$\therefore E[n_c^2(t)] = E[n_c^2(t)]$$

$$② E[n_c(t) n_s(t)]$$

$$\Rightarrow \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E \left[ a_k \cos 2\pi(k-K)\Delta ft + b_k \sin 2\pi(k-K)\Delta ft \right] \\ \left[ a_k \sin 2\pi(k-K)\Delta ft - b_k \cos 2\pi(k-K)\Delta ft \right]$$

$$\Rightarrow \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E \left[ a_k^2 \cos^2 2\pi(k-K)\Delta ft \sin^2 2\pi(k-K)\Delta ft \right. \\ \left. + b_k a_k \sin^2 2\pi(k-K)\Delta ft \right. \\ \left. - a_k b_k \cos^2 2\pi(k-K)\Delta ft - b_k^2 \sin^2 2\pi(k-K)\Delta ft \right] \\ \cos 2\pi(k-K)\Delta ft$$

We know that for a stationary random process

$$E[a_k b_k] = 0 \quad \xrightarrow{\text{Uncorrelated to each other}}$$

$$E[a_k^2] = E[b_k^2] \quad \xrightarrow{\text{Equal Variance}}$$

∴ we have

$$E[n_c(t) n_s(t)] = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E \left[ a_k^2 \cos 2\pi(k-K)\Delta ft \right. \\ \left. \sin 2\pi(k-K)\Delta ft \right. \\ \left. + 0 - 0 - b_k^2 \sin 2\pi(k-K)\Delta ft \right. \\ \left. \cos 2\pi(k-K)\Delta ft \right] \\ = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} E \left[ a_k^2 \cos 2\pi(k-K)\Delta ft \sin 2\pi(k-K)\Delta ft \right. \\ \left. - a_k^2 \sin 2\pi(k-K)\Delta ft \cos 2\pi(k-K)\Delta ft \right] \\ = 0 \quad ; \quad \therefore E[n_c(t) n_s(t)] = 0$$

Problem :-

$$\rightarrow \text{Find the value of } E[n_c(t) n_s(t)] \text{ & } E[n_c(t) n_s(t)]$$

$$\text{where } n_c(t) = \frac{d}{dt} n_c(t) \quad \&$$

$$n_s(t) = \frac{d}{dt} n_s(t)$$

Answer :- 0

→ Power Spectral Density of Quadrature Component  
 (or) [PSD of  $n_{dt}(t)$ ,  $n_{ct}(t)$ ]

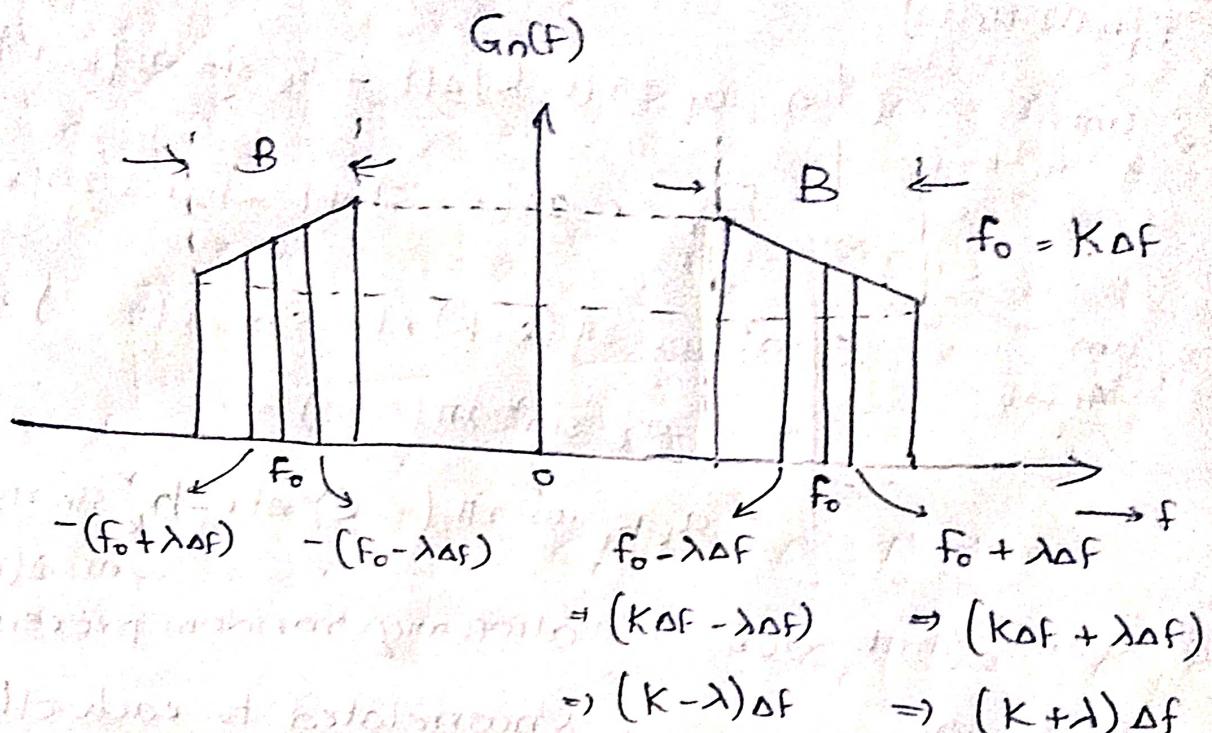

fig :- Power Spectrum of bandlimited noise

Consider non-white noise is having non-uniform noise PSD and  $f_0$  need not be located at its centre.

To determine the PSD of  $n_{ct}(t)$ ,

- ① Select the spectral components of noise  $n(t)$  from the value of  $k = (K - \lambda)$  to  $(K + \lambda)$  where  $\lambda$  is an integer.

Since  $K \Delta f = f_0$ , the selected components correspond to frequencies  $(K - \lambda) \Delta f$  to  $(K + \lambda) \Delta f$  i.e., from  $(f_0 - \lambda \Delta f)$  to  $(f_0 + \lambda \Delta f)$ .

We know  $n_{ct}(t)$  as

$$n_{ct}(t) = \lim_{\Delta f \rightarrow 0} \sum_{k=1}^{\infty} \left[ a_k \cos 2\pi(k-K)\Delta f t + b_k \sin 2\pi(k-K)\Delta f t \right]$$

Find  $\Delta n_c(t)$  within this interval i.e,

$$\boxed{\Delta n_c(t) = n_c(t) \Big|_{k=k-\lambda} + n_c(t) \Big|_{k=k+\lambda}} \rightarrow (1)$$

$$\Rightarrow \Delta n_c(t) = a_{k-\lambda} \cos 2\pi(k-\lambda - k) \Delta f t + b_{k-\lambda} \sin 2\pi(-\lambda) \Delta f t$$

$$+ a_{k+\lambda} \cos 2\pi(k+\lambda - k) \Delta f t + b_{k+\lambda} \sin 2\pi(\lambda) \Delta f t$$

$$\Rightarrow \Delta n_c(t) = a_{k-\lambda} \cos 2\pi \lambda \Delta f t - b_{k-\lambda} \sin 2\pi \lambda \Delta f t + a_{k+\lambda} \cos 2\pi \lambda \Delta f t + b_{k+\lambda} \sin 2\pi \lambda \Delta f t$$

These 4 terms are of same freq,  $\lambda \Delta f$  and are uncorrelated random processes.

- (2) These random processes are stationary, consider at time  $t = t_1$ ;  $\cos 2\pi \lambda \Delta f t_1 = 1$  &  $\sin 2\pi \lambda \Delta f t_1 = 0$  where  $\lambda \Delta f t_1$  is then integer

$$\Delta n_c(t_1) = a_{k-\lambda}(1) - 0 + a_{k+\lambda}(1) + 0$$

$$\Rightarrow \boxed{\Delta n_c(t_1) = a_{k-\lambda} + a_{k+\lambda}} \rightarrow (2)$$

- (3) Find the power  $P_\lambda$  associated with  $\Delta n_c(t_1)$  and interrelate  $P_\lambda$  with PSD  $G_{nc}(f)$  &  $G_n(f)$

$$\therefore P_\lambda = E[\Delta n_c(t_1)^2]$$

$$= E[(a_{k-\lambda} + a_{k+\lambda})^2]$$

$$= E(a_{k-\lambda}^2) + E(a_{k+\lambda}^2) + 2 \underbrace{E[a_{k-\lambda} a_{k+\lambda}]}_0$$

$$\Rightarrow \boxed{P_\lambda = E[a_{k-\lambda}^2] + E[a_{k+\lambda}^2]} \rightarrow (3) \quad \because \text{uncorrelated to each other}$$

We know that  $P_k = 2 G_n(k\Delta f) \Delta f$

$$\therefore P_\lambda = 2 G_n(\lambda \Delta f) \Delta f$$

$$E[a_{k-\lambda}^2] = P_{k-\lambda} = 2 G_n((k-\lambda) \Delta f) \Delta f$$

$$E[a_{k+\lambda}^2] = P_{k+\lambda} = 2 G_n((k+\lambda) \Delta f) \Delta f$$

$$\therefore \text{eq. ③} \Rightarrow P_\lambda = E[a_{k-\lambda}^2] + E[a_{k+\lambda}^2]$$

$$\Rightarrow P_\lambda = \overline{a_{k-\lambda}^2} + \overline{a_{k+\lambda}^2}$$

$$\Rightarrow 2 G_n(\lambda \Delta f) \Delta f = 2 G_n((k-\lambda) \Delta f) \Delta f + 2 G_n((k+\lambda) \Delta f) \Delta f$$

$$\Rightarrow G_n(\lambda \Delta f) = G_n((k-\lambda) \Delta f) + G_n((k+\lambda) \Delta f) \quad \boxed{④}$$

We know that  $f_0 = k\Delta f$ , replace  $\lambda \Delta f$  by a continuous freq. variable  $f$ ,  $\therefore$  eq. ④ becomes

$$G_n(f) = G_n(f_0 - f) + G_n(f + f_0)$$

Similarly the same procedure can be adapted to find the PSD of  $n_s(t)$  & a similar expression can be obtained for  $n_s(t)$

$$G_{n_s}(f) = G_n(f) = G_n(f_0 - f) + G_n(f_0 + f)$$

for  $n_s(t) \therefore P_\lambda = \overline{b_{k-\lambda}^2} + \overline{b_{k+\lambda}^2}$  we know that  $\overline{a_k^2} = \overline{b_k^2}$   
 $= \overline{a_{k-\lambda}^2} + \overline{a_{k+\lambda}^2}$  & remaining is same

To get the PSD of either  $n(t)$  or  $n_s(t)$  graphically  
 displace +ve & -ve portions of  $G_n(f)$  towards left &  
 right sides respectively by an amount  $f_0$ , so that  
 the portion of the plot originally located at  $f_0$  now  
 coincide with the ordinate and by adding these two  
 plots, the plot for either  $n(t)$  or  $n_s(t)$  can be obtained

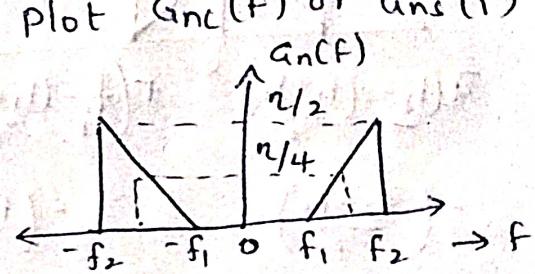

→ Problem

The noise PSD for noise  $n(t)$  is shown in fig. Plot the  
 PSD for  $n(t)$  or  $n_s(t)$  i.e., plot  $G_{nc}(f)$  or  $G_{ns}(f)$

$$\textcircled{1} \quad f_0 = f_1$$

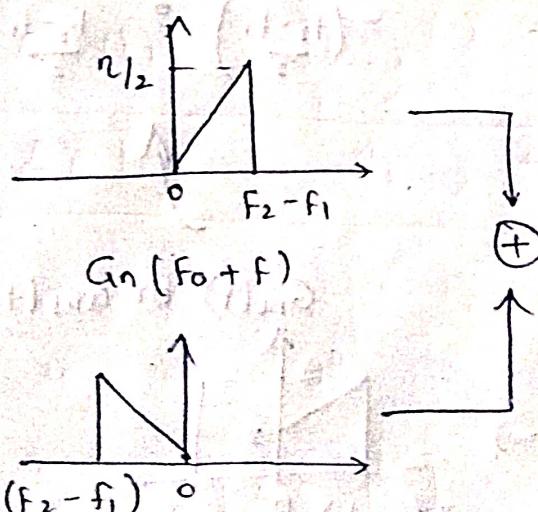

$$\textcircled{2} \quad f_0 = f_2$$

$$\textcircled{3} \quad f_0 = \frac{f_1 + f_2}{2}$$

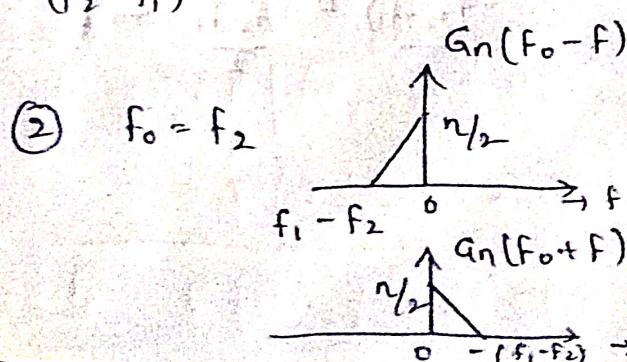

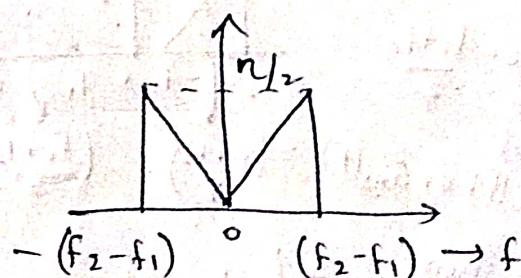

$$\text{Ans} \quad \textcircled{1} \quad f_0 = f_1 \quad G_{n(f)} = G_n(f_0 - f) + G_n(f_0 + f)$$

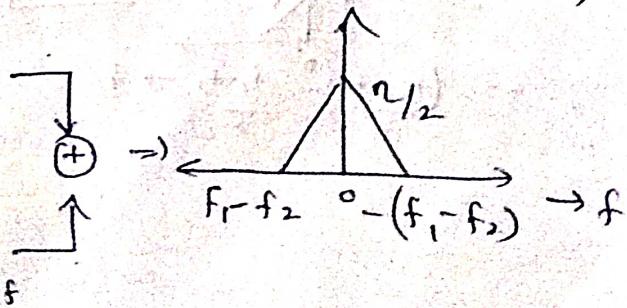

$$G_n(f_0 - f)$$

$$G_{nc}(f) \text{ or } G_{ns}(f)$$

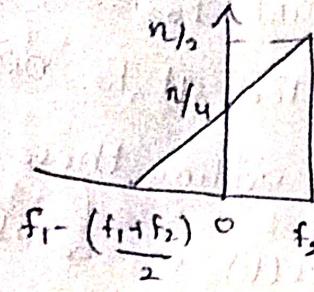

$$G_{nc}(f) \text{ or } G_{ns}(f)$$

$$③ f_0 = \frac{f_1 + f_2}{2}$$

$$G_n(F - f_0)$$

$$f_1 - \left( \frac{f_1 + f_2}{2} \right) \circ \quad f_2 - \left( \frac{f_1 + f_2}{2} \right) \rightarrow F$$

$$(f_2 - f_1) \quad +$$

$$G_n(F + f_0) \quad (f_2 - f_1)$$

$$- \left( f_2 - \left( \frac{f_1 + f_2}{2} \right) \right) \circ \quad - \left( f_1 - \left( \frac{f_1 + f_2}{2} \right) \right) \rightarrow F$$

$$- \left( f_2 - f_1 \right) \quad - \left( f_1 - f_2 \right)$$

$$\Rightarrow \frac{f_1 - f_2}{2} = - \left( f_2 - f_1 \right)$$

$$\Leftrightarrow \frac{f_1 - f_2}{2} = \left( f_2 - f_1 \right)$$

$$G_{nc}(F) \text{ or } G_{ns}(F)$$

$$\Rightarrow \frac{n/2}{2} \circ \quad \frac{f_2 - f_1}{2} \rightarrow F$$

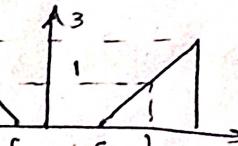

$$- \left( f_2 - f_1 \right) \quad \frac{f_2 - f_1}{2}$$

→ Problem :-

$$\text{if } G_n(F)$$

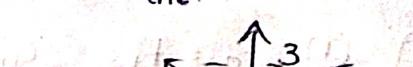

$$① f_0 = \frac{f_1 + f_2}{2}$$

$$G_n(F)$$

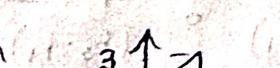

$$\text{find } G_{nc}(F) \text{ or } G_{ns}(F) \quad - \left( f_1 + f_2 \right) \quad \left( \frac{f_1 + f_2}{2} \right)$$

$$G_{nc}(F) \text{ or } G_{ns}(F)$$

$$- \left( f_2 - f_1 \right) \circ \quad \frac{f_2 - f_1}{2} \rightarrow F$$

An) then

$$- \left( f_2 - f_1 \right) \circ \quad \frac{f_2 - f_1}{2} \rightarrow F$$

$$+ \quad \Rightarrow$$

$$G_{nc}(F) \text{ or } G_{ns}(F)$$

$$- \left( f_2 - f_1 \right) \circ \quad \frac{f_2 - f_1}{2} \rightarrow F$$

$$- \left( f_2 - f_1 \right) \circ \quad \frac{f_2 - f_1}{2} \rightarrow F$$
